

PunchLight SOLO - USB Recording Warning Light

About PunchLight SOLO:

The PunchLight SOLO is designed for anybody working in project, dubbing, or post production studios who needs visual confirmation of when a recording begins or ends. This simple, precise and easy to use device is perfect for musicians and sound engineers as well as film, tv and video editors. The device illuminates red or yellow according to the recording mode and has the ability to control any signalling system already fitted in the studio. It is easy to install in any studio environment.

The PunchLight SOLO is a small USB powered light unit which indicates Recording start/stop and record "standby". The product signals "recording" by glowing red and "standby" by glowing yellow. The unit is powered directly from USB. No PSU or Midi Interface required!

Hardware Setup

1. Connect the unit to a USB port on your computer using a USB cable.

Software Setup

1. Download the Punchlight USB software utility (download from www.punchlight.com/download)
2. Open the software utility
3. Activate the HUI protocol in your host application (Pro Tools, Logic Pro, Nuendo etc).
Please refer to the host application's user manual.
5. Adjust lamp brightness for your studio - turn the lamp on manually by selecting the "Switch on" Yellow LED check box.

The device is ready to use.

- The red LED can be turned on manually via the "Switch on" Red LED check box. Doing so overrides the automation.
- The default Application mode is "Pro Tools". This can be changed to "Generic", to work with applications such as Nuendo, Cubase, Logic Pro, Digital Performer or Samplitude. There is a new setting just for Logic version 9, which can now automate lights.
- Yellow LED automation - set to "Disabled" prevents the yellow LED switching on via automation (it can still be turned on manually).

Technical specification

Voltage5V DC (USB)
Max Current150mA
Weight0,2 kg (including 3m cable)
Dimensions95 x 24mm
